

1. General Description of the Session (Narrative Vision)

Central Message

In today's global and digital world, trust is no longer automatic or given, but it must be actively designed, communicated, and verified. Organizations that succeed are not only those that offer quality products, but those that are capable of building scalable systems of trust across borders, cultures, and digital environments.

Narrative Vision

Our session will explore the concept of trust as a system, using our work with Farmit as a starting point and expanding it to a broader societal and organizational context.

During our challenge, we discovered a key insight:

Trust is not transferable and must be rebuilt in every new context.

Farmit's expansion challenge revealed that even a strong, trusted brand cannot simply replicate its success in new markets without adapting how trust is created and perceived. This insight will serve as the foundation of our session.

Rather than focusing on the company solution itself, we will extrapolate this learning to explore how trust operates in:

- Global food systems
- Digital platforms
- Technology and AI
- Consumer behaviour

We will show that trust today depends on:

- Transparency
- Digital proof
- User experience
- Human connection

Why This Topic Matters

Trust is becoming one of the most critical challenges of our time:

- Consumers question the origin of products
- Digital platforms connect strangers without physical interaction
- Technologies like AI and deepfakes challenge the reliability of information
- Globalisation increases the distance between producers and consumers

Understanding how trust is built is essential not only for companies but also for citizens, institutions, and future professionals.

Extrapolation Beyond the Challenge

While our case focused on an agri-food startup, the concept of trust applies broadly across:

- **Industries:** food, technology, e-commerce, platforms
- **Communities:** urban vs rural, local vs global consumers
- **Technologies:** blockchain, digital traceability, AI systems
- **Societal challenges:** misinformation, sustainability, ethical consumption

Our session will demonstrate that trust is a universal challenge, and that designing it effectively can drive meaningful change.

2. Detailed Structure of the 20-Minute Session

Overview of Structure

Section	Topic	Time
1	Introduction & Hook	2 min
2	The Problem: The Trust Gap	3 min
3	Insights from Farmit	4 min

4	Key Idea: Trust as a System	5 min
5	External Examples	4 min
6	Conclusion & Takeaway	2 min

1. Introduction & Hook (2 minutes)

- Start with a relatable question:
"Would you trust food produced in another country by someone you've never met?"
- Briefly introduce the topic: trust in a global world
- Present the central idea: trust is no longer automatic

Transition:

"This simple question reveals a much bigger issue: the growing gap between global systems and human trust."

2. The Problem: The Trust Gap (3 minutes)

- Explain how globalisation creates distance between producers and consumers
- Highlight key challenges:
 - Lack of transparency
 - Information asymmetry
 - Cultural differences
 - Digital disconnection
- Introduce the concept of a "trust gap"

Transition:

"To understand how this problem works in practice, we turn to our case: Farmit."

3. Insights from Farmit (4 minutes)

- Present key learning from the challenge:
 - Trust is built locally
 - It cannot be transferred automatically
 - Consumers need visible proof of quality
- Briefly reference your solution (without going into detail):
 - Digital transparency (Interactive Portal)
 - Physical entry point (Far meat)
- Emphasise the key lesson:

Trust must be actively built through experience and verification

Transition:

"But this is not just a Farmit problem. It reflects a broader transformation in how trust works today."

4. Key Idea: Trust as a System (5 minutes)

Introduce the central concept:

Trust is no longer a feeling but a system that must be designed.

Explain the components of modern trust:

- **Transparency** → knowing where things come from
- **Verification** → proof (data, certifications, traceability)
- **User Experience** → intuitive and accessible information
- **Connection** → human stories and relationships

Explain that organisations must:

- Design trust intentionally
- Use digital tools to support it
- Align ethics and business strategy

Transition:

"To see how this applies beyond food, let's explore real-world examples."

5. External Examples (4 minutes)

Present 2–3 examples:

Example 1: Digital Platforms (Airbnb / Uber)

- Trust between strangers
- Reviews and ratings as trust systems

Example 2: Food Transparency (Blockchain / Traceability)

- Tracking the origin of products
- Reducing fraud and increasing confidence

Example 3: Technology & AI

- Avoid misinformation
- Growing crisis of trust in digital content

Key message:

Different industries face the same challenge: **how to build trust at scale**

Transition:

“So what should we take away from all of this?”

6. Conclusion & Takeaway (2 minutes)

Reinforce the central message:

“In the future, successful organisations will not only deliver products or services but also design trust.”

Final points:

- Trust is a strategic asset
- It requires continuous effort
- It affects everyone, not just companies

End with a reflective question:

“If trust must be designed... what role will you play in building it?”

3. Group Role Assignment

Presentation Roles

Section	Presenter
Introduction & Hook	Alonso Sara
The Trust Gap	Grilo Miguel
Farmit Insights	Weizhuo Sun
Trust as a System	Aizaz Yushay
External Examples	Ronghao Jin
Conclusion	Ronghao Jin
